

How has China's Gross Domestic Product (GDP) evolved between 2012 and 2023 ?

Estimates on official sources showed that China's GDP grew 5.2 percent year on year in 2023, hitting a high record and beating the growth target of around 5 percent. The International Monetary Found (IMF) expects China's GDP growth to slow to 4.6% in 2024 with weak exports and real estate problems dragging down activity.
